

Post Implementation Evaluation Report

AVPN Replacement of Legacy Wide Area Network II – Information Technology Services, Office of

Project Dates: 7/2012 through 6/2013

Project Cost: \$3,972,935

Project Objectives:

This project replaced the aging broadband switching and transmission technology network with an AT&T Virtual Private Network (AVPN) technology next generation network. AVPN eliminates the dependence on a particular DLL (Data Link Layer) technology of the frame relay network by transmitting variable-length data packets more efficiently. AVPN is a network service that uses IP multi-protocol label switching to create a private network inside the AT&T network or the “AT&T Cloud.”
